LINDSTROM PRECISION TOOLS

The expression "the right tool for the job" could not be more appropriate than in a discussion about handtools. Whether in the hands of a skilled professional or a new operator, the right tool can make the most difficult operation a simple task. Lindstrom Precision Tools is your source for the right handtool for electronic, electromechanical and medical device assembly, rework and repair.

WWW.LINDSTROMTOOLS.COM

Lindstrom Precision Tools invites you to visit our new web site. Our latest up to date information is now available to you either on screen or via download. Enjoy our always available comprehensive web site featuring the best in assembly, rework and repair tools.

Web site includes:

- Lindstrom's complete range of products.
- Ergonomics.
- Trade show & product exhibition.
- New products.
- Literature availability (Catalogs, Brochures and Flyers).
- Quick link to downloadable high resolution product photographs.
- Where to find Lindstrom Distributors in your area.
- How to contact a local Lindstrom Manufacturing Representative.
- And much more.

Log on today and discover Lindstrom Precision Tools. We stand ready to solve your assembly, rework and repair needs.

NEW

TRx 8180 HEAVY-DUTY CUTTER

Lindstrom introduces a large cutter in the RX series for use on copper wire, wire cables and hard wire applications. The TRx 8180 heavy-duty cutter can handle solid copper wire and hard steel wire from 0.5 mm/0.02 inch up to 2.75 mm/0.11 inch utilizing the new "progressive cut" bevelled edges. The specially designed thumb-release spring can be disabled so the TRx 8180 will slide into and out of utility belts easily.

See page 59.

ESD SAFE PLASTIC CUTTERS

ESD safe requirements are no longer just confined to electronics manufacturing. Today electronic equipment requires maintenance across varied areas, the demand for more ESD safe tools has increased. Therefore, Lindstrom now offers two new plastic cutters built to the same existing standards as our already well-known product ranges.

The P6140 and P6160 are suitable to cut cable ties on wire harnessing and plastic components within electronics equipment. These rugged Lindstrom tools offer the user a well balanced feel and a high quality precision cut, ideal for cutting shielded cable, multi-core cable, plastic sprues and flashing within many injection molding applications.

See page 60.

PRECISION SCREWDRIVER SETS

Lindstrom introduces a new range of precision screwdrivers. Four sets are available comprising differing combinations of the Slotted, Phillips, Pozidriv and Torx type tips.

(AVAILABLE IN EUROPE ONLY.)

See page 90.

NEW

ESD SAFE EASYTOUCH TWEEZERS

Lindstrom introduces a select line of Swiss-made tweezers with soft, "tactile" grips. This assortment features eight of our most popular tweezer types.

See page 61.

CARBON FIBRE TWEEZERS WITH REPLACEABLE TIPS!

Lindstrom offers a new replaceable tip feature on five of our most popular carbon fibre tweezers. These high quality Swiss tweezers are ideal for use where an optimal balance between stiff tips and smooth surfaces is required. Typical applications include handling and placing of electronic components and devices.

See page 78.

SL SERIES TWEEZERS

Lindstrom introduces a line of competitively priced, high quality, Swiss made tweezers. This new assortment features 15 of our most popular tweezer types.

CHOOSING THE RIGHT HANDTOOL

In today's complex assembly environment, it is important to understand and consider the different requirements and conditions that affect your choice of handtools.

For example:

- **How frequently are you going to use the tool?**
- **What type of result are you trying to achieve?**
- **What kind of material are you going to cut or bend?**
- **Can you use one tool instead of two?**
- **Do you have concerns about ESD or other specialized standards?**

These questions and many more should be considered in making your choice. We have included additional information to assist you in choosing the right tool for your application.

Cutters

LINDSTROM HISTORY

Started in 1856, Lindstrom has set the standard in precision tool manufacturing. The oldest continuous producer of handtools in existence today, Lindstrom maintains its edge over the competition through its technical understanding, response to market needs, and commitment to advanced technology. Metallurgy, manufacturing techniques, and tremendously skilled crafts people (particularly in the hardening of steel) are the hallmarks of this world renowned Swedish manufacturer.

Some companies have been able to implement one facet or another of the Lindstrom manufacturing cycle. Others have attempted to copy the form, appearance and even the actual part numbers of Lindstrom cutters. However, none has been able to successfully blend all the elements that are required to achieve the level of performance recognized worldwide as belonging to a true Lindstrom cutter.

The Rx8211 combines good application visibility, hand and tool positioning capability and small size with great strength. It is among one of the best angle head tools on the market and a prime example of that which is truly Lindstrom – precision with power. See page 43 for more on Rx8211.

workers, tool manufacturers designed a cutter that left a wide, pyramid-shaped lead end after cutting. Its hardness was adequate for the strain put on the cutter blades. Moreover, the cutters had to be designed with an overall ruggedness: capable of withstanding a drop from a ten-story building without being severely damaged.

However, as the electronics and other related industries developed, the requirements on tools, and in particular cutters, became far different. For example, many people believe that an electrician must do a lot of cutting. Yet, an electrician may make

An electronic assembly operator may make more cuts in one month than an electrician makes in a lifetime.

BACKGROUND

Many years ago, cutters were primarily used in heavy-duty work, i.e., cutting heavy electrical wire and wires used in the telecom field. In order to meet the requirements of linemen and other general use

Cutters

fewer cuts in his lifetime than some electronic assembly workers make in one month! Therefore, the need for cutting small wires thousands and thousands of times necessitated a radically new and innovative technology.

The Rx8140 used in traditional over-hand grip. See page 40 for more on Rx8140.

Small cutters were needed that could cut both extremely small and relatively large diameter wires, often of quite different materials. In addition, the lead ends had to be quite different since the solderability of these wires was of paramount importance. These lead ends had to be covered completely and properly with no bare copper (or basis material) exposed.

Compounding the problem was the accessibility issue, as not all cutters could get into the same area. Transmission of the mechanical shock of cutting to sensitive semiconductors added even more cutter design challenges. However, despite some manufacturers' claims to the contrary, there are no secret or "magic" materials or processes that can give

you some kind of "super" cutter for all applications. Some inherent "trade-offs" in the design of tools and choices must be made in order to meet certain application requirements. For example:

At what point is the cutter head small enough to gain access and still be able to withstand the impact of cutting wires (of various sizes) innumerable times?

How flush should the cutting edges be in order to meet tough specifications yet still keep tool life extended to the maximum? And what about resistance to edge damage due to occasional misuse?

To what degree of hardness should the tool be made in order to extend tool life and still limit breakage due to being too brittle?

What type of joint should be put into a tool to extend the precision of the cutting edges and still be cost effective for you to use?

Understanding these trade-offs is the key to making an objective and cost-effective choice of tools for your specific application.

MATERIALS

Every cutter begins with basic materials. However, materials can vary greatly with just a minute change in the mixture. A slight adjustment to the ingredients can affect how a particular steel reacts, and Lindstrom has been refining this mixture for almost 150 years.

The 1% Carbon, combined with a pinch of chrome and various other materials, is very similar to the steel grade and mixture used for high quality ball bearings. This is the material used for Lindstrom Rx and 80-Series cutters.

Cutters

RESILIENCY

One of the challenges in tool design and usage alike is the search to increase tool life. Decreased life is caused generally by usage beyond the limits of the material and its corresponding hardness.

The use of ball bearing grade steel together with proper heat treatment offers the possibility of a cutter of tremendous resiliency and toughness with the ability to withstand greater impact, yet with the ability to return to its original form without damage. This is one of the reasons why Lindstrom cutters offer greater life and have less breakage than other brands used in the same applications.

LUBRICITY

Another characteristic that emerges from a Lindstrom cutter is the ease with which the tool makes its cut. It is as if there is a built-in lubricant, which makes the cutting easier. This not only helps to make a better cutter, but also reduces operator fatigue.

HARDNESS

Different steels have different personalities – each allowing a certain level of hardness. If a specific steel is hardened too much for its composition, it will break easily. On the other hand, not enough hardening can sharply reduce tool life. How a steel is

cooled (after hardening) and recognizing the different strength capacities of that steel are some of the key factors that make the hardening process a difficult science to master.

Measuring the hardness on a Rockwell Hardness Scale, Lindstrom cutters are elevated to a hardness of 63-65 on the cutting edge, as marked on the "C" scale of the tester. This hardness ranks among the highest of any cutters made. For most manufacturers, this hardness level would create a high breakage rate.

Yet, because of the steel and proper control and consistency of the hardening area, and even when used beyond the rated capacity (as they often are!) Lindstrom cutters have remarkably little breakage.

Cutters

METHODS OF MANUFACTURING

FORGINGS

One of the major breakthroughs in Lindstrom technology is the ability to produce exact, precision forgings. Without that capability, the automated production process cannot be utilized effectively. Therefore, as the first step in the manufacturing cycle, forgings are a key element in the total production process. To maintain interchangeability, every forging must be perfectly precise and compatible to one another.

Stamped tools have a straight grain; this construction is useful for certain applications but ultimate tool life and strength can be compromised.

Cutters produced by an extrusion method have a cross grain structure; thus, they are susceptible to greater breakage, particularly along the cutting edges and the joint.

Forged cutters are usually the strongest. Their grain structure follows the profile of the cutter.

Despite automation, any production process can be extremely limiting if not utilized effectively. Lindstrom effectiveness is directly related to the use of forgings of exact dimensions. When forgings are not uniform, it becomes nearly impossible to obtain the repeatability necessary to produce a consistent quality tool. Attempts have been made by others in the industry to automate the manufacturing process without such forgings, but the tools produced are physically erratic. The result is an increased breakage level or rapid deterioration of the cutting edges – expensive tools at any price.

The Rx8247 and even more refined Rx8248 (top), extend the range of applications for angle head cutters. See page 44 and 45 for more on Rx8247 and Rx8248.

Cutters

PROCESSES

Anyone involved in manufacturing knows that to attain a quality process, there are no shortcuts – learning must be by doing. Subsequent steps in the Lindstrom cutter production process have been painstakingly developed over a 30-year period backed by 150 years of precision tool production and know-how. Lindstrom is constantly seeking the best way to achieve consistent quality results. These results are seen in the perfect symmetry of the cutter components, the exactness of the grinding, and the consistent hardening. The reliability and consistency of these details are the Lindstrom hallmark.

CUTTER JOINTS

Of the three primary types of connections commonly used – lap joint with screw, box joint, and lap joint with rivet – each has a distinct value that you should consider in evaluating your choice of cutter.

LAP JOINT WITH RIVET

The lap joint with rivet is both economical and effective for those tools used for occasional work or for heavy-duty cutting where the requirements for precision are not as great. This joint's limitation is that it is difficult to achieve the precision of a screw and nut in terms of holding torque and bearing surface for moving parts and thus it can loosen or develop "play" more easily over time. This leads to misaligned cutting edges, a property that is not conducive to exact and continuous cutting.

BOX JOINT

The box joint is an older process, developed initially for the jewelry trade where intricate and precise forming of delicate metals is required. The joint is made by sliding one side through the opening of the other side of the joint. Once cooled, the opening closes or is closed, tightening the two sides, which are then linked by a rivet. Most manufacturers typically expand the slot in the head to allow the other half of the tool to be assembled. This offers the possibility of introducing variations on inner contact surfaces in terms of finish and tolerances.

LAP JOINT WITH SCREW

The lap joint with screw is the marriage of a fine pitch threaded screw and miniature nut. It is extremely important that these two parts are geometrically correct. However, there is more to achieving strength and precision in the joint than that. For example, a screw-and-nut combination that is absolutely flush with the edge of the tool may have insufficient threads to maintain consistent alignment. On the other hand, a screw-and-nut combination that has external heads on both sides of the joint may limit the cutter's possibility to be used for a number of tight access applications. Lindstrom eliminated this predicament through the positive integration of both designs. With one flat external head and one flush head, both adverse conditions are eliminated. In the end, this design assures the user of sufficient threads for continuous alignment and a narrower profile for greater accessibility.

Cutters

CUTTER HEAD SHAPE AND SIZE

Head shapes vary in size and configuration depending on the application. However, there are four primary types, with variations of each.

OVAL HEAD

Most common of all the head shapes is the oval head. Combining strength and flexibility, the oval head can withstand and distribute the impact of cutting and is utilized in a myriad of applications.

The head shape combined with materials, method of manufacturing, type of cut, and the tool's hardness, determine the range of cutting capability.

The Rx8130 with miniature oval head will cut copper wire up to 1.25mm/16 gauge in diameter. Yet, the Rx8130 is far smaller than models from other manufacturers considered to be of similar capacity and is one of the strongest miniature cutters on the market. See page 40 for more on Rx8130.

TAPERED HEAD

When the sides of a cutter head are shaped along diagonal lines, the operator can effectively broaden the range of tasks this tool can fulfill. The Lindstrom

tapered head cutter utilizes this design without reducing the cutting range, and increases the number of areas that the operator can gain access to.

However, since the tapered head does not stand up to occasional misuse so well as an oval head design of similar dimensions, a greater degree of care should be observed in its use.

Tapered Rx8143 allows better tip access yet still has a good general range of cutting capacity. See page 41 for more on Rx8143.

Tapered Rx8143 improves cutting access in component removal. See page 41 for more on Rx8143.

Cutters

TAPERED AND RELIEVED HEAD

This head style is the smallest of the standard cutting heads available. Not only does it taper on both sides, but also the underside is cut away, allowing the operator to gain access into some difficult areas. Although this provides an obvious advantage, this head style does have a slightly reduced cutting range.

Special care should be taken not to use tapered and relieved cutters outside their specified range of cutting capability.

Tapered and relieved Rx8146 provides improved access and visibility for even the most difficult job. See page 41 for more on Rx8146.

Tip cutter Rx8149 is an even more specialized adaptation of the tapered and relieved style. Its extreme tapering on all sides allows access and reach. See page 42 for more on Rx8149.

Cutters

Angle head Rx8247 provides benefit of reach and operator visibility. See page 44 for more on Rx8247.

Rx8211 (top) offers outstanding strength and cutting capacity while Rx8247 (bottom) offers better reach. See page 43 for more on Rx8211 and page 44 for more on Rx8247.

ANGLE HEAD

This head shape is sometimes called an oblique style with its head set at an angle to the main body of the cutter, the purpose of which is to reach between wires or parts or into areas

which are difficult to access. Tools of this design can also be used to trim standard leads or parts – with the advantage being that the operator's hand can be in a different position if desired. The cutting range of the angulated head will vary depending upon its style, but some degree of care should be observed in its use.

The Rx8140 (left) used in traditional over-hand grip. Rx8247 (right) allows an inverted grip in a similar application. See page 40 for more on Rx8140 and page 44 for more on Rx8247.

Cutters

CUTTING EDGES

Explaining the type of cut that a particular cutter makes is perhaps the greatest area of confusion and worthy of special study as there is no real standardization of terminology, and each brand offers its own description of its type of cut. Understanding these differences is particularly important in the ordering process.

It is imperative that you recognize what type of cut you require and what the cut lead-end should look like after it is cut. This is especially true in the tighter requirements and specifications of military and high-end commercial electronics.

THE SEMI-FLUSH CUT

This type of cut leaves a large lead-end, shaped like a pyramid, and has been manufactured for decades by every tool manufacturer. This type of cutting edge is a good application match

for general electrical or hobby cutting where tool price is often the primary consideration.

This application match is good due to the fact that the cut lead shape is satisfactory for these applications and the cutting edge itself does not require a high level of hardness, sophisticated material to achieve that hardness, or an extremely precise type of joint in order to function.

THE MICRO-BEVEL® CUT

To meet the requirements of the electronic assembly industry, Lindstrom designed the Micro-Bevel. Its unique cut is quite different from the semi-flush cutter. Its leads are "pinched", unlike the pyramid look of the semi-flush cut, allowing less altitude and smaller overall surface area. Because of its design, it has an extremely wide cutting range, and a variety of uses far beyond any other cutter produced today. For example: Lindstrom produces a cutter (Rx8130) that has a cutting range for copper from 0.2 mm/32 gauge to 1.25 mm/16 gauge yet has a remarkably small overall head size.

THE FLUSH CUT

The cutting result of most "flush" cutters, their individual terminology notwithstanding, is somewhat similar. Flush cutters also pinch the leads, but at a lower altitude than Micro-Bevel cutters.

Cutters

These cutters have finer cutting edges than semi-flush or Micro-Bevel cutters.

Lindstrom's flush cut also creates a pinched lead. However, it is configured slightly differently than that produced by other cutters. The Lindstrom flush cutter leaves a narrower and shorter taper along the pinch, thereby reducing the total exposed area. The reason for using a Lindstrom flush cutter rather than the Micro-Bevel is to meet a slightly tighter specification for the cut lead-end or to gain a more flush result to a board, component, or part.

EXCEEDING THE FLUSH CUT

Many manufacturers have a cut which, in reality, is just a smaller pinch, allowing OEMs to meet solderability specifications and alleviate shock. This pinched lead is deemed acceptable for many items produced for high-specification applications, but confusion is caused by the size and height of the pinch as each cut will vary from brand to brand and between manufacturers.

The general consensus is that the greater this pinch becomes, the less the acceptability of the cut. The critical area here is realizing that as the cutter wears down, the size of the pinch increases and could rise above the maximum acceptable height. Moreover, the greater the pinch, the greater the mechanical shock transmitted.

THE ULTRA-FLUSH® CUT

The question to be addressed then is why have a pinch cut at all? Lindstrom engineers have designed

the Ultra-Flush cutter which virtually eliminates the pinch other cutters make. The Ultra-Flush configures two flat planes with a barely discernible line separating each of these planar surfaces. Only a precise screw joint and a

specially designed radius on the cutting edge could allow this razor-sharp edge to be utilized effectively.

The trade-off in this case is a more limited cutting range and greater possibility for edge damage due to misuse. However, with the exception of Lindstrom's own Micro-Bevel and Flush cutters, the Ultra-Flush will outlast any other "flush" or "shear" type of tool and still match competitive cutting ranges.

The unique design of the Ultra-Flush is perfect for use in close tolerance electronic and medical device assembly where concerns about final lead-end configuration and mechanical shock transmission are a top priority.

Almost all Rx and 80-Series cutters can be equipped with a lead-catcher. See page 96 for more on lead-catchers.

Pliers

PLIERS

EXTENSIONS OF THE HAND

Holding pliers are used on the toughest, most forceful applications – from removing plate steel retaining pins on an oil derrick to the most sensitive and sterile of environments such as surgery. This is because pliers represent the functional expression of replicating and increasing the capabilities of the human hand across many dimensions, particularly of the thumb and adjoining finger, in terms of force and precision.

The 8140 cutter and 7891 holding plier combine capabilities in some electronic "surgery." See page 48 for more on 8140 and page 56 for more on 7891.

That is why holding pliers are available today in an almost limitless number of shapes, styles, configurations, materials and sizes.

PLIER EVALUATION

Evaluating pliers in an objective manner is not a straightforward task. Cutters, for example, can be put on a machine or on the assembly line, and capacity or number of cuts can be tested with some degree of confidence.

Holding pliers are not so easily tested in an objective way – again, because of the almost limitless way in which they are configured and used and also because of their often very long service life.

The forces at work on pliers are also different from cutters. In a cutter, force and wear act on the joint in primarily a single plane, and the overall concern is the precision with which the joint keeps the edges in alignment together with the performance of the cutting edges and jaws when subject to the impact and wear of continuous cutting. By comparison, the joint in a holding plier must be able to withstand the very high and often simultaneous force of multiple plane actions such as holding and twisting in combination with pushing or pulling. In addition, in most applications actual wear on the plier jaws is somewhat secondary to the concern with the ultimate strength and resistance to breakage of the jaws with maximum force applied. Therefore, holding plier performance and capability tend to be strongly influenced by the type and quality of construction of the pivot joint used.

The Rx7890 in an inverted grip is used to straighten a connector pin. See page 46 for more on Rx7890.

Pliers

The consideration of the positives and negatives of each of these constructions can be somewhat different than for cutters. The key is to take these considerations into account together with your intended application and frequency of use so that you can make an informed, cost-effective decision.

LAP JOINT WITH RIVET

The most common joint used in pliers is the lap joint with rivet. This is due to the cost and performance of such a construction being suitable for many general-purpose tasks. However, lap joint with rivet pliers have a tendency towards a number of problems in assembly tasks where the overall tool itself cannot be made big enough to compensate for the possible weaknesses of this joint. Specifically, the jaws have a tendency to roll over when lead forming, and “play” due to wear can be rapid.

Therefore, although lap joint with rivet pliers often have the lowest price, this joint tends not to have the life or the performance capability often required of small pliers for intricate forming. If the operator is using a larger, medium- to heavy-duty plier, the lap joint with rivet will often suffice as the joint and plier itself are now large enough to offset the joint wear and flex issues present in smaller pliers.

BOX JOINT AND LAP JOINT WITH SCREW

Lindstrom technical analysis has found that the box joint plier or lap joint with screw serves assembly industries best. These allow the plier to retain rigidity, maintaining the correct alignment of the jaws, and preventing “jaw roll” when forming. This condition often is prevalent in other types of pliers

Bent nose Rx7892 allows operator to use an over-hand grip and side access to connector pin and can provide visibility advantages in other applications as well. See page 47 for more on Rx7892.

and becomes especially obvious as the tool begins to wear and the joint loosens.

The construction of the Lindstrom box joint is of special consideration because it features a unique design and construction. This design allows the slot in the joint to remain undisturbed and thus undistorted when the two halves of the tool are assembled. This results in a joint of greater precision and smoothness, thus ensuring long life with minimal wear.

Pliers

The Rx7890 with a gentle side bevel and strong tips can be used for almost any type of bending and forming. See page 46 for more on Rx7890.

The rigidity of the box joint utilized by Lindstrom allows the plier to be configured with a longer jaw and greater taper. This is advantageous for a number of reasons, some of which are obvious – some of which are not. The longer jaw, in combination with the rigid box joint, allows greater accessibility of work without the concern of “jaw roll.”

Equally important but not so obvious is the opportunity to reduce the number of pliers needed on the workbench. For example, if you are using a lap joint with rivet pliers, separate small needle nose or chain nose pliers may be required for very fine work. Otherwise,

you will have the rolling action common to most lap joint with rivet pliers. However, the greater taper allowed by the rigid Lindstrom box joint plier means that the actual tip of the plier can be much smaller than other types of pliers, relative to the jaw length. This slope greatly increases the range of diameters possible when lead forming. As a consequence, you can utilize fewer tools for more applications. The trade-off once again is the price consideration since the box joint or lap joint with screw pliers are usually priced higher than plain lap joint with rivet types. However, in view of the greater utility of a Lindstrom box joint plier, the ultimate cost is often less.

The Rx7891 (left) with serrations adds additional gripping friction when required. Rx7890 (right) has smooth jaws for reduced possibility to scratch surfaces. See page 46 for more on Rx7890 and Rx7891.

Tweezers

TWEEZERS

Throughout the evolution of tweezers as a range, some tweezer styles such as 1, 2, 3C, 5, AA, etc., have remained as identical in design and as popular in usage as in the past. However, even though many tweezer styles carry generic designations, there are variances within each style, depending on the origin. Once the style is determined, special attention should be given to four important criteria:

- 1. How are the tweezer tips finished?*
- 2. How symmetrical are the two sides?*
- 3. How delicate do they feel?*
- 4. How easily do they handle small parts?*

MATERIALS

Once these factors are determined, then the next step is to decide what tweezer material is to be used. A wide variety of materials are available: Carbon, stainless, special stainless materials, nickel plating, nickel-content, and even beryllium and titanium. However, for use in most assembly or repair situations, three primary types will suffice: carbon, stainless, and special stainless steel.

MATERIAL DESIGNATION

Standardized suffix letters designate materials. These designations are listed below with the consideration for each material.

CARBON STEEL

Carbon steel has strong, flame-hardened tips, but has low rust resistance and can develop a high level of magnetism. If the tweezer is made of Carbon steel, there will be no suffix letter. (Example: "3.")

STAINLESS STEEL

Stainless steel is rust-resistant with reasonably strong tips, but with less hardness and shorter life than carbon. In time, however, they are susceptible to rust and magnetism (care and use factors notwithstanding.)

If the tweezer is made of stainless steel, the tweezer will be designated with the suffix letter "S." (Example: "3-S.")

Tweezers

SPECIAL STAINLESS STEEL

This special stainless steel is 304/305 stainless steel which has excellent anti-acid (resistant to hydrofluoric and nitric acids), anti-magnetic, and rust-resistant properties. Its special properties make it the most popular material used today. If the tweezer is made of this steel, it will be labeled with the suffix "SA." (Example: "3-SA.")

SMD HANDLING TWEEZERS

If SMDs are manipulated by hand, solderable surfaces can be contaminated and lead to faulty joints. Tweezers can alleviate this problem as well as make handling SMDs easier.

In many situations, tweezers are superior to other handling devices such as vacuum pick-ups. For example, in desoldering, tweezers give a firmer grip – especially when dealing with wave soldered components glued to a board. In positioning individual components, tweezers can give the operator better control of location and pressure.

Along with perfect tip alignment and gripping surfaces that fit the shape and size of the component, it is important that the tweezers' paddles or tips have smooth edges and be highly polished and totally free of burrs or marks. If not, then damage to the components or the board itself could result.

The tips should also be at an oblique angle in order to allow the operator the greatest visibility, which is especially important when working with fine pitch components.

The tweezers should have sufficient opening so that manual opening of the handles is not needed. (Reverse action tweezers excepted.)

Design

DESIGN

ERGONOMICS

Professionals used to be satisfied with very durable steel tools. This emphasis on durability meant that almost all attention was focused on the composition of steel, the life of cutting edges, joints, etc. Thus, for many years, the design of high quality tools for professional use in industry has been technology driven, rather than operator oriented.

Today, users are more demanding in terms of function and comfort. As a matter of fact, a growing number of professional users now demand tools that meet the highest standards of performance and simultaneously reduce the risk of injury in the short and long term.

Design

This demand is primarily due to two factors: First, the increased concern with safety at the workplace, particularly with regard to the frequent involvement of both repetitive motions and high force in many industrial tasks, often in combination with poor hand/arm posture caused by the inappropriate design of some traditional handtools. The costs for the use of inappropriate handtools, unsuitable work stations, and job routines will, of course, be shared among the individual operators, the company, and society in the form of direct medical expenses, work lost, reduced quality, training of workers, disruption of work, increased insurance and administrative costs.

Second, this demand reflects the recognition of the importance of quality as well as output volume in many industrial tasks, and the need for tools which enhance not only user capabilities but which also offer the ability to give consistent, high performance results – day in and day out.

By introducing ergonomists and industrial designers into the design process, additional focus is being placed upon industry and operator demands. Thus, the dynamics of tool use, operator preference and the size and shape of the handtool are now all design priorities.

Lindstrom Rx7890 plier exemplifies state - of - the - art handtool design, function and performance. For more on Rx7890 see page 46.

Design

DESIGN PRIORITIES

A good handtool should **reduce the risk of direct injury**. It should:

- *not have any sharp edges on the handle.*
- *minimize wear and tear on the skin.*
- *reduce the risk of users' hands getting caught in tight spots.*
- *reduce the risk of users' hands coming into contact with sharp edges.*
- *be slip-resistant.*

A good handtool should **reduce the risk of long-term injury**. It should:

- *have the optimal weight for its purpose.*
- *have a grip that protects the user from hot and cold temperatures.*
- *minimize the build-up of muscular tension during lengthy jobs.*
- *have a large gripping surface that exerts low, even pressure across the hand.*
- *deliver the greatest possible power with the least possible effort.*
- *be perfectly balanced.*

A good handtool should **make the user's job easier**. It should:

- *be the correct size and design for its purpose.*
- *be able to be used in different positions.*
- *be adjustable in many different positions.*
- *be adjustable – even when wearing gloves.*
- *be designed for use with either hand.*
- *be easy to hold, with the right degree of friction against the skin.*
- *be available in different sizes, suitable for different tasks.*
- *tolerate lubricants and solvents.*

GOOD HANDTOOLS

ARE NO ACCIDENT

As a consequence of the demands on modern handtools, good handtools are not developed by accident and are not created in isolation. They have to be developed in collaboration with working professionals, together with specialists in ergonomics and industrial design. Our handtools are good because we take the time to ponder and review the results of this collaboration. They are good because we do not rush. We create better tools by taking one step at a time.

The result? Quite simply, better handtools. We guarantee it. Tools that are:

- **Easier to use.**
- **More comfortable to hold.**
- **Significantly more functional.**
- **Deliver more power.**
- **Give the user a better sense of control.**
- **Enable greater precision.**

Take a look at the Lindstrom Rx cutters and pliers on page 42 and screwdrivers on page 90, for examples of our commitment to meeting your requirements.

Rx Cutters and Pliers

Rx

LINDSTROM Rx

THE ULTIMATE IN PERFORMANCE, PRECISION AND COMFORT

To be the leader in a competitive field takes dedication, hard work, and practice, which is exactly what Lindstrom has been doing since 1856 – perfecting the best handtools money can buy. For nearly 150 years, we have designed and refined the world's leading cutters and pliers. And in that time, we have learned what works, and what doesn't. But to fully comprehend what makes the Rx the very best, one should take a close look at the Rx and then compare all else on the market to it. The Rx will always come out on top.

Micro-Touch™ is the shape that makes it possible to control and rotate the Rx between thumb and index finger for precision work.

TAKE A CLOSER LOOK AT THE Rx

THE Rx PROFILE

The profile of the Rx grip is slightly rounded and wide, creating excellent surface distribution and contact.

ESD-PROTECTION

The ESD-safe composition of our Rx grips combines resins with conductive additives to produce a material that safely dissipates electrostatic charges, reducing possibility of damage to sensitive components.

WARNING : Rx grips are not insulated and therefore Rx cutters/pliers should never be used on electrified equipment.

Rx Cutters and Pliers

BioSPRING®

Since it is the traditional nature of a return spring to provide greater resistance the more it is compressed, this has been a challenge for ergonomists whose goal is to make work easier and safer.

The solution lies in Lindstrom's new, patent applied for, BioSpring®, a solution that is as simple as it is ingenious – where the material and design work together to provide new characteristics.

Rx PLUS BioSPRING®

- Tension is kept minimal and limited throughout the working cycle of the tool.
- Handle width is controlled for ease of tool pick-up and handling.
- Tension and opening width can be adjusted to suit your preference via three different ports.
- Almost indestructible in normal use.

Rx PLUS BioSPRING® COMPARED WITH TRADITIONAL SPRINGS

**CUTTER
AT REST**

**CUTTER
AT WORK**

TRADITIONAL SPRING

Rx PLUS BIOSPRING®

This graph clearly shows the benefit of reduced spring tension offered by the BioSpring® when compared to hand tools that utilize traditional springs.

TO ADJUST Rx

1. Pull the tool apart.

2. Place the spring in the desired port.

3. Close the tool.

Rx Cutters and Pliers

1% CARBON/CHROME BALL BEARING GRADE STEEL

Material usually reserved for high stress applications provides incredible impact resistance and resiliency with smoother, cleaner penetration at the cutting edge.

FORGED COMPONENTS

Grain structure follows profile of the blank to maximize tool strength.

CNC GRINDING OF FORGED BLANKS

Computer controlled grinding guarantees edge angle accuracy and contact which increases tool reliability and consistency.

63-65 HRC ON CUTTING EDGES

Precision induction hardening of 1% Carbon/Chrome Ball Bearing Grade Steel allows high Rockwell hardness without brittleness, resulting in a longer lasting tool.

MICRO-BEVEL®

Micro-Bevel cutters leave a minimal rise on cut leads resulting in a smaller overall surface soldering area.

FLUSH

Lindstrom flush cutters leave an even narrower and shorter rise on cut leads than the Micro-Bevel in order to meet a tighter specification for the cut lead-end or to achieve a more flush result to a board, component or part.

ULTRA-FLUSH®

The unique Ultra-Flush cutters leave a flat surface on cut leads, which is considered to be the ultimate in conformance to tough soldering and mechanical shock specifications.

PRECISION SCREW JOINT

Adjustable screw joint minimizes friction and maximizes alignment of cutting edges.

LEAD-CATCHERS

Lindstrom's patented lead-catcher is an accessory that stops just-cut ends of wire from falling into critical or sensitive areas, which could result in a short circuit or contamination. Almost all Rx cutters can be factory

equipped with a leadcatcher. Just add "S" to the tool part number. Ex. Rx 8140-S.

80-Series Cutters

80-SERIES

LINDSTROM 80-SERIES TRIED AND TRUE PERFORMANCE FOR THE TRADITIONAL USER

Surpassed only by our own Lindstrom Rx range, the Lindstrom 80-Series remains the top choice for the traditional user. This range of cutters offers unsurpassed cutting capacity covering a wide range of wire dimensions and types. The reasons are:

1% CARBON/CHROME BALL BEARING GRADE STEEL

Material usually reserved for high stress applications provides incredible impact resistance and resiliency with smoother, cleaner penetration at the cutting edge.

FORGED COMPONENTS

Grain structure follows profile of the blank to maximize tool strength.

CNC GRINDING OF FORGED BLANKS

Computer controlled machine grinding guarantees edge angle accuracy and contact which increases tool reliability and consistency.

63-65 HRC ON CUTTING EDGES

Precision induction hardening of 1% Carbon/Chrome Ball Bearing Steel allows high Rockwell hardness without brittleness resulting in a longer lasting tool.

MICRO-BEVEL®

Micro-Bevel cutters leave a minimal rise on cut leads resulting in a smaller overall surface soldering area.

FLUSH

Lindstrom flush cutters leave an even narrower and shorter rise on cut leads than the Micro-Bevel in order to meet a tighter specification for the cut lead-end or to achieve a more flush result to a board, component or part.

FLUSH

ULTRA-FLUSH®

The unique Ultra-Flush cutters leave a flat surface on cut leads, which is considered to be the ultimate in conformance to tough soldering and mechanical shock specifications.

ULTRA-FLUSH

PRECISION SCREW JOINT

Adjustable screw joint minimizes friction and maximizes alignment of cutting edges.

REPLACEABLE SPRINGS

Due to the long life of 80-Series tools, replaceable springs help reduce down time and stocking of substitute tools.

LEAD-CATCHERS

These patented 80-Series accessories hold cut wires, preventing injury and keeping leads from flying into the assembly. Almost all 80-Series cutters can be factory equipped with a lead-catcher. Just add "S" to the tool part number. Ex. 8140-S.

ESD PROTECTION

All 80-Series cutters can be equipped with DS or CO handles to meet specialized ESD requirements.

WARNING: 80-Series grips are not insulated and therefore 80-Series cutters should never be used on electrified equipment.

Supreme Cutters and Pliers

SUPREME

**LINDSTROM SUPREME
GOOD PERFORMANCE FOR THE
TRADITIONAL USER**

Good performing cutters and pliers for general electronics work, repair and fine mechanical work.

Most of the cutters and pliers in the Supreme series have a specially made box joint with extra long contact surfaces, made possible by a special manufacturing technique. Undesirable joint movement is held to a minimum, ensuring extremely precise alignment of the jaws, even at the extreme tip.

Multi-Purpose Shear

LINDSTROM MULTI-PURPOSE SHEAR

UNIQUE PERFORMANCE IN DEMANDING TELECOM AND ELECTRONICS APPLICATIONS

As the number of special telecom applications grows, there is an increasing need for cutters that can handle demanding insulation materials such as the Kevlar elements used in fiber optic and other types of cables.

The HS6000 shear is designed to meet these needs with ease. With a durable, precision screw joint and high carbon 57-59 HRC steel blades serrated on one edge, it cuts easily and precisely without letting the material being cut slide away.

Designed to combine ease of use with durability and precision, the HS6000 fits comfortably in either hand while its cushioned ESD-safe non-slip grips provide a secure grasp. Ideal for cutting insulation, cables, ties and all types of corded materials, the HS6000 is a true multi-purpose shear.

ESD-safe.

Tweezers

TWEEZERS

LINDSTROM TWEEZERS THE ULTIMATE IN PERFORMANCE AND PRECISION

Although tweezers are produced in many countries, firms with years of assembly experience turn to Swiss-made tweezers in order to be assured of the highest precision and consistent uniform quality.

Swiss-made Lindstrom tweezers offer perfect balance, tip alignment, and symmetry as well as a wide range of materials to meet your most sophisticated and demanding requirements. In addition to general assembly, our product line includes models specifically designed for SMDs, ESD-sensitive areas, and medical and laboratory applications as well.

Torque Screwdrivers

TORQUE SCREWDRIVERS

HIGH PRECISION TORQUE CONTROL MADE EASY

With a unique, high-precision cam-over torque-limiting design, Lindstrom's new generation of Torque Screwdrivers virtually eliminate over-application of force, thereby reducing the risk for damage and rework costs. Available in Micro-Adjustable or Preset Torque versions, Lindstrom's Adjustable Torque Screwdrivers offer unmatched user comfort, thanks to a user-friendly shape and non-slip grip. Built to last and with a non-magnetic bit holder that accepts any standard drive, the ideal choice for flexible applications as well as volume production. All models are ESD-safe.

MICRO-ADJUSTABLE TORQUE SCREWDRIVERS

The Micro-Adjustable Torque Screwdriver allows instant change to the torque value with an easy-to-read window scale and a precise pull-to-set, push-to-lock mechanism. Adjustment is easy. Just pull the knob, turn it to the desired torque, push in the knob and it is ready to use!

The Micro-Adjustable Screwdriver series includes three models ranging from 10 to 450 Ncm or 20 in.oz. to 40 in.lbs. Accuracy +/- 6%.

PRESET TORQUE SCREWDRIVERS

Sharing the ruggedness, comfort and precision of the Micro-Adjustable version, the Preset Torque Screwdriver is an excellent choice for volume manufacturing applications. The desired torque value is easily set using an internal adjustment screw accessible by removing the end cap of the handle. The Preset Torque Driver is available in four models, covering a torque range of 4 to 450 Ncm or 6 in.oz. to 40 in.lbs. Accuracy +/- 6%.

All models are ESD-safe.

Certified to the following industry specifications:
ASME B107.14 M-1994 and ISO 6789, EN 26789/1994.

Screwdrivers

ESD SCREWDRIVERS

Electrostatic Discharge (ESD) can affect or ruin electronic equipment or components such as semi-conductors, memories and processors.

For secure use in electronics assembly Lindstrom precision screwdrivers with 2-component ESD safe handles should be used. The ESD-safe composition of the grips combines resins with conductive additives to produce a material that safely dissipates electrostatic charges, reducing possibility of damage to sensitive components.

Four sets of ESD Screwdrivers are available comprising differing combinations of the Slotted, Phillips, Pozidriv and Torx type tips. The tops are movable in different colours depending on the tip selection. As the grips are not insulated these screwdrivers should never be used on electrified equipment.

ESD-PROTECTION

The ESD-safe composition of our screwdriver handles combines resins with conductive additives to produce a material that safely dissipates electrostatic charges, reducing possibility of damage to sensitive components.

WARNING: The screwdriver handles are not insulated and therefore the screwdrivers should never be used on electrified equipment.

ERGO® SCREWDRIVERS

THE ULTIMATE IN PERFORMANCE, PRECISION AND COMFORT

Exhaustive studies and tests, both practical and in the laboratory, lie behind the handle design of Ergo® screwdrivers. These studies showed how a screwdriver is really used and how the handle should be designed to obtain a comfortable and effective grip in all conceivable situations.

These tests resulted in a handle that has different diametrics for different functions. The large part of the handle allows high torque to be applied. The small part of the handle can be used with a sensitive touch for speedy tightening or loosening of screws. The fingers can work on the comparatively large diameter of the neck, which means that it is possible to tighten the screw longer with only the fingertips before resistance increases, when the grip is transferred to the upper part of the handle.

The cross-section, material and surface texture of the handle are also the result of extensive research and testing. Besides being comfortable to use in different work situations, the round and efficiently patterned shape permits high torque to be applied. The handle always fits comfortably in the hand – no sharp edges as on a square handle, for example, which may cut painfully into the hand.

The International Standard as determined by ISO stipulates minimum torque requirements for screwdrivers. The strength of Ergo® screwdrivers exceeds the requirements of the ISO standard by a good margin, in some cases by more than 60%.

The blade is made of specially hardened steel and corrosion protected by plating. The tip is of Pro-point design, which means that it is phosphated for maximum dimensional accuracy and no peeling. Larger screwdrivers are equipped with a practical hexagonal drive on the blade, so that a wrench can be

used whenever a greater torque is needed.

The shape and strength of the screwdriver tips conform to the requirements of national and international standards in accordance with ISO 2380.

Screwdrivers

TAKE A CLOSER LOOK AT ERGO® SCREWDRIVERS

- *Three-component handle. Combines strong core with good grip.*
- *Easy to choose the right tip with color-coded handle and symbol on the end. Color and symbol don't wear out.*
- *Large, rounded end lets you apply force without hurting the palm of your hand.*
- *Can be hung on a peg or secured by string.*
- *Only rounded contours. No pressure points, no matter how you hold or use the screwdriver.*
- *Soft, high-friction material with ridged surface for comfortable grip and maximum friction even when the hand is oily.*
- *Flat face so the screwdriver won't roll.*
- *Optimal length on the handle neck. Fingers are always correctly positioned for quick turning and precision control.*
- *Cylindrical shaft with small diameter to tighten and loosen screws quickly and easily.*
- *Hexagonal nut on certain models so you can use a wrench if you need to apply extra torque.*

Ergo® screwdrivers:

- *Easier to use.*
- *More comfortable to hold.*
- *Significantly more functional.*

Special Engineered Tools

SPECIAL ENGINEERED TOOLS

There is always a need for tools to fulfill certain special requirements that cannot be met by regular production tools. Our Special Engineered Tools are designed for those applications.

The tools pictured here are only a small sampling of the many different designs we have manufactured as solutions to difficult assembly or rework requirements.

The Lindstrom staff can design special application tools by working from "before" and "after" components, engineering drawings, or prototypes. We even build tools drawn on the back of a napkin. It's that easy!

We can modify tweezers to move tiny wafers without scratching the surface, or build extra-long-nosed pliers for extracting proprietary equipment. We can make one prototype or several hundred.

Our designers have created over 1000 custom tools that were manufactured to perform a wide variety of actions on leads and components. Lindstrom has built specially engineered tools to:

- *Cut and form.*
- *Insert and extract.*
- *Standoff cut.*
- *Straighten.*
- *Cut and swedge.*
- *Hold threaded shafts.*
- *Service custom automated machines.*

(AVAILABLE IN NORTH AMERICA ONLY.)

How To Choose

HOW TO CHOOSE?

Deciding which cutter to use among the very large assortment offered in this catalog can be challenging, to say the least. In addition, there can be several good options to choose from for a given application. We are often asked, "Why do you offer such a large range of handtools, and specifically, so many cutters?" There are two primary reasons for having such a large assortment.

First, the applications served by these tools are almost infinite. From a pure application point of view, more specialized tools are often required to achieve the most cost effective and technically sound result. In addition, requirements in terms of size and composition of materials to be cut or bent and the end result required can change very rapidly in the fast-moving assembly industry. So maintaining a wide assortment gives you assurance that you can find a good solution for future application requirements that you may not have at present.

Secondly, applications are only a part of the reason for such a wide assortment. The fact is that beyond certain basic safety and health guidelines in proper tool usage, operator preference in terms of positioning, visibility, reach, experience, etc., varies greatly from one operator to another, with very few clear "right or wrong" aspects. So rather than trying to convince you to choose from a limited range which is easier for us to make, we would rather completely satisfy your requirements and preferences. And that means we have to offer many variations.

However, even with that understanding, choosing can still be a challenge! Here are some basic suggestions that can help you narrow your choice to a few very good options.

How To Choose

WHAT KIND OF CUTTING RESULT DO YOU WANT?

1. If the cutting result is not critical, then go with the Micro-Bevel as this cutting edge bevel gives you the best capacity and life in most applications.
2. Use the Flush if Micro-Bevel is not suitable.
3. Use the Ultra-Flush only when required, as it requires the most care in use.

WHAT ARE THE TYPES AND DIAMETERS OF MATERIAL YOU WANT TO CUT?

All of our cutters are rated for copper wire. However, quite often you are not cutting simple copper wire.

But we rate them for copper as that is a standard that almost all can relate to. Some cutters are also rated for tougher material such as spring wire. Again, you are not likely to be cutting spring wire either.

However, almost everything else you are cutting will fall in toughness between copper and spring wire.

So here you have to use a bit of common sense. For instance: Is the material a little tougher than copper or a lot? This will further narrow the field by eliminating the cutters not likely suitable for the application.

IS ACCESS (SPACE AVAILABILITY) TO THE APPLICATION AN ISSUE?

If access is not a challenge, then lean towards an Oval head - in as large a size as possible - as this is the strongest type of head configuration. One basic fact of the assembly and repair environment is that a cutter on a workbench or in the field will at one time or another be used on something either larger or harder than the original intended application. This is when having chosen a Lindstrom, which is "over-engineered" and conservatively rated to begin with and the strongest and largest configuration in the Lindstrom range that can be used for the application, makes sense. And saves you a lot of money - the tool will much more easily survive occasional misuse and continue to give good results.

If access is an issue, then try to use a smaller Oval head. If that puts you out of cutting range or is still too large at the tip, then move over to a Tapered head.

If a Tapered head still doesn't fit the application, then go with the Tapered and Relieved head.

How To Choose

IS REACH OR ANGLE TO THE APPLICATION AN ISSUE?

Then consider an angle or tip cutter. However, keep in mind that the smallest configurations in this type should then be reserved for that application and used with considerable care.

DO YOU REQUIRE ESD PROTECTION ON YOUR HANDTOOLS?

If so, then select from the Rx range or order 80-Series or Supreme ranges with ESD-safe handles installed.

DO YOU REQUIRE LEAD-CATCHERS TO KEEP CUT LEADS FROM GOING INTO SENSITIVE AREAS?

If so, then simply add an "S" suffix after the cutter part number to have a lead-catcher installed.

CONTACT US

If you still have questions about which tools are best suited for your application, we strongly encourage you to contact one of our factory trained salespeople. Our representatives can make informed recommendations or furnish tools for evaluation where they provide the best opportunity for you to observe their value – on the job. On our Website, www.lindstromtools.com, you will find our world-wide presence and can easily locate a Lindstrom professional ready to help you find the right tool for the job.

Heavy-Duty Cutter

NEW

TRX 8180 HEAVY-DUTY CUTTER

The TRx 8180 heavy-duty cutter can cut solid copper wire and steel wire from 0,5 mm/0,02 inch up to 2,75 mm/0,11 inch utilizing the new "progressive cut" bevelled edges.

- *Non-slip handle with "gills" produces a positive grip.*
- *New progressive cutting edges – suited for copper wire at the tip and hard steel wire near the jaws – for versatile operation.*
- *Tough design makes this cutter ideal for production, maintenance, repair and service applications.*
- *Micro-Bevel cutting edges hardened to 63-65 HRC for durable performance.*
- *High leverage joint to reduce cutting force.*
- *Easy on/off spring enables reduced profile for easy storage.*

ESD Safe Plastic Cutters

NEW

ESD SAFE PLASTIC CUTTERS

The P 6140 and P6160 are suitable to cut cable ties on wire harnessing and plastic components within electronics equipment, also ideal for cutting shielded cable, multi-core cable, plastic sprues and flashing within many injection molding applications.

- *Tapered and Relieved cutting head for applications where access is limited.*
- *Extremely strong construction for long lasting performance.*
- *Ultra Flush cutting edges provide a smooth and clean cut.*
- *Ergonomic handles provide an on/off spring for use at operator's option.*
- *ESD safe handles.*

NEW

EASYTOUCH TWEEZERS

- High quality, precision tweezers
- Static dissipative material provides reliable ESD protection
- Anti-acid, antimagnetic stainless steel for use in many electronics environments
- ESD safe packaging protects tweezers on workbench and in tool cases

All tweezers are ESD-safe and pictured in original size (100%)

Screwdrivers

PRECISION SCREWDRIVER SETS

Lindstrom introduces a new range of precision screwdrivers. Four sets are available comprising differing combinations of the Slotted, Phillips, Pozidriv and Torx type tips.

- *Two-component ESD safe handle.*
- *Moveable top in different colours depending on the tip selection.*
- *Main colour black with grey for softer material.*

ESD-PROTECTION

The ESD-safe composition of our screwdriver handles combines resins with conductive additives to produce a material that safely dissipates electrostatic charges, reducing possibility of damage to sensitive components.

WARNING: The screwdriver handles are not insulated and therefore the screwdrivers should never be used on electrified equipment.
